DATA SCIENCE | MACHINE LEARNING | AI

MOTIVATION

Data Scientist with a Master of Artificial Intelligence degree from RMIT University and hands-on experience developing machine learning solutions using Python. Experienced in data preparation, predictive modelling, statistical analysis, and model evaluation through research, academic projects, and a Machine Learning Engineering internship at Silverpond. Passionate about applying AI to solve real-world problems and improving outcomes through data-driven research.

SKILLS & TOOLS

Programming: SQL, Python, R, Java, C, C++

Machine Learning & AI: PyTorch, TensorFlow, Scikit-learn, OpenCV, YOLO, CNNs, Computer Vision, Feature Engineering, Model Evaluation, Hyperparameter Tuning

Data Science & Statistics: Predictive Modelling, Classification, Regression, Clustering, PCA, Association Rule Learning, A/B Testing, Hypothesis Testing, Causal Impact Analysis, Statistical Analysis

Tools & Technologies: Git, Jupyter Notebook, Anaconda, Scikit-learn

Mathematics: Linear Algebra, Probability, Statistics, Experimental Design

PROJECTS

Enhancing Targeting Accuracy Using Machine Learning

- By analyzing historical customer behavior and campaign data, developed a [machine learning](#) model to predict the likelihood of customers signing up for a \$100 annual membership. This enabled the retailer to identify high conversion customers, reduce mailer distribution costs, and significantly [improve return on investment \(ROI\)](#). The solution provided insights for more targeted, cost-effective marketing strategies.

Predicting Customer Loyalty Using Machine Learning

- Led the development of a predictive model to estimate customer loyalty scores for a grocery retailer's untapped customer base. After market-level loyalty [data was only available for 50% of the customer database](#), I built a machine learning solution to identify key [relationships between customer behavior and loyalty metrics](#). This enabled the retailer to predict accurate loyalty scores for the remaining customers, ensuring [better customer segmentation, targeted marketing, and more effective communication](#) strategies ultimately improving customer retention and engagement.

Assessing Campaign Performance Using Chi-Square Test For Independence

- Conducted an [A/B test](#) for a grocery retailer's promotional campaign of their new "Delivery Club" membership program. Customers were randomly divided into three groups: low-cost mailer, high-cost mailer, and a control group. [Analyzed the differences in signup rates between the mailer types](#) to determine the most effective marketing strategy. The insights generated provided the client with clear recommendations for optimizing future campaigns, allowing for smarter marketing spend allocation and improved ROI.

PROJECTS (CON'T)

Global Earthquake Tracking Dashboard (Tableau)

- Developed an interactive Tableau dashboard that visualizes [global earthquake activity over a 30 day period](#). The dashboard enables users to explore key patterns, magnitudes, and regional distributions of seismic events. By focusing on intuitive design and visually engaging features, it provides quick insights into earthquake [frequency, intensity, and geographical trends](#), empowering users to analyze and interpret seismic data with ease.

EXPERIENCE

Machine Learning Engineer, Intern - Silverpond

JUNE 2025 - DEC 2025

- To [enhance perception capabilities](#), I contributed to Highlighter by developing and [optimizing computer vision models](#), improving overall model performance by ~18% across multiple use cases.
- To improve [object detection and segmentation](#) performance, I trained YOLO-based models in Python, [increasing detection accuracy by 22%](#) and reducing inference time by 15% in production environments.
- To enable precise agricultural analytics, I built a semantic segmentation model for chicken beak detection, [achieving an IoU score of 0.87 and improving annotation efficiency by 30%](#).
- To strengthen urban scene understanding, I developed and fine-tuned models for trains and trams, [improving object recognition accuracy by 20%](#) in complex real-world environments.
- To support scalable deployment, I collaborated with cross-functional teams to integrate machine learning solutions, [reducing model deployment time by 25% across diverse datasets and pipelines](#).

EDUCATION

Master of Artificial Intelligence

2021 - 2023 - RMIT University

Bachelors of Computer Science and Engineering

2016 - 2020 - SRM University
